Often you can hear the opinion that Einstein poorly understood mathematics and generally studied extremely badly. This argument is often given as a "justification" of the bad study of modern schoolchildren. But is it?

In fact, Albert Einstein from an early age demonstrated phenomenal successes in mathematics and physics. In school years, he already knew these items in a much greater extent than the school program required, and received only excellent assessments in physics and mathematics.

But where did this strange delusion come from that Einstein still did not know mathematics? The fact is that Einstein failed to enter the Swiss Higher Polytechnic School of Zurich from the first time. However, during the entrance exams, he nevertheless passed physics and mathematics on the highest score, but did not reach the desired results to some other subjects. In addition, a year later, at the age of 17, Einstein, tightening the rest of the subjects, entered this university. Therefore, the reason for the occurrence of this myth is still not fully understood.

It is also interesting to think about why this myth still exists and is not forgotten? Everything is simple here. The fact is that lazy people in such fictional stories find an excuse for themselves. For example, those who are poorly studying at school and believe in the myth of Einstein, can say: "I like Einstein, just not straining ahead of time, but someday, I still show what it is capable of ...". Yes, that's just nothing they will no longer show ...
